FM-TUNER 1896DFC

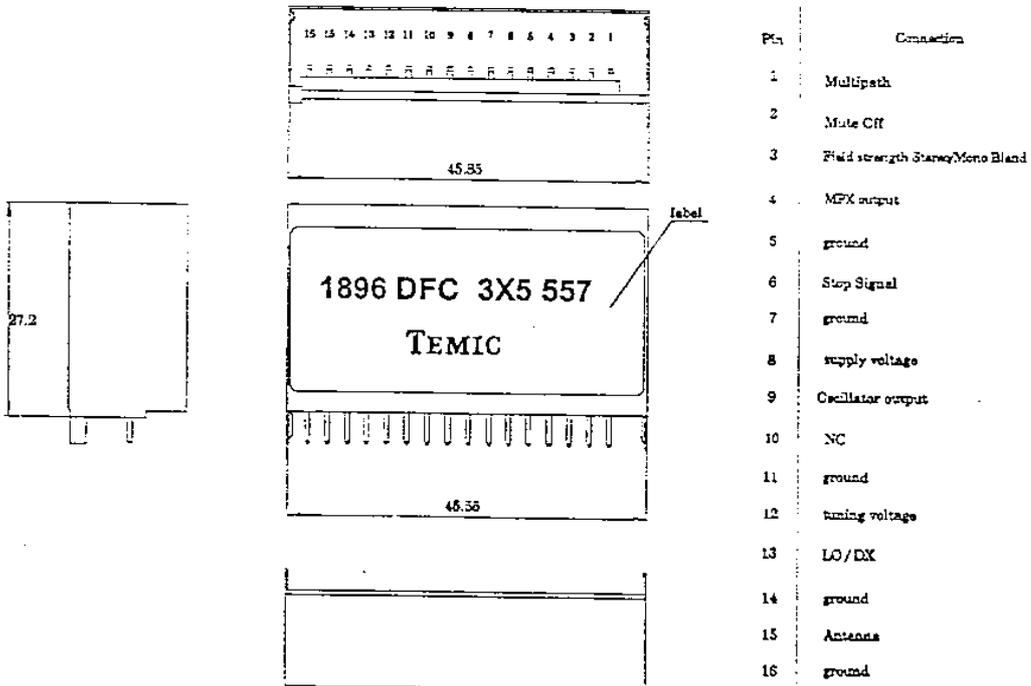

3X5 557

FINAL ELECTRICAL SPECIFICATION

A) DESCRIPTION

The FM Tuner 1896 DFC is designed for high quality car radios. The frequency range is from 87.5 Mhz to 107.9 Mhz. The RF portion of the tuner incorporates a tunable band stop circuit to improve the image rejection. The high input sensitivity is realised by a band pass filter and three additional ceramic filters.

The input stage gain is automatically adjusted when a strong input signal is detected to enable the detection of weak signals in the presence of strong interfering stations.

B) TUNER INTERFACE

- Multipath: Identification output provides an analog dc voltage ($5V_{DC}$ to $0V_{DC}$) during multipath interference.
- Mute: With muting " ON " (active) , audio output muting of up to 40 dB can be obtained when no RF signal is received at the antenna.
- LO/DX : At this pin the search /seek sensitivity of the FM tuner can be changed by altering the DC level.
- Stop Signal : This signal is active low and generated by the field strength level and the frequency deviation signal. The stop signal sensitivity is adjusted by the LO/DX input.
- Field strength : If a weak input signal is detected , a low level field strength will blend the radio from stereo to mono mode to preserve the fidelity of the audio output.
- Oscillator output : The oscillator output is provided for an external frequency synthesizer. The oscillator frequency is set at 10.7 MHz (IF) above the intended reception frequency.
- MPX Output : Output with a typical strength of 250 mV RMS.

C) ELECTRICAL DATA

TEST #	PARAMETER	MIN.	TYP.	MAX.	UNIT
1	Survival Voltage	---	---	12	Volts
2	Operation Supply Voltage	7.5	---	12	Volts
3	Testing Supply Voltage	---	8.7	---	Volts
4	Supply Current at 8.7 Volts	---		90	mA
5	Tuning Range	87.5	---	107.9	MHz
6	Tuning Voltage Range	1.5	---	7.5	Volts
7	30 dB S+N/N 22.5 KHz Dev., 400 Hz Mod.	---		3.0	μ V
8	Mute Characteristic 22.5 KHz Dev., 1 KHz Mod.				
	Vin = 3 μ V	0	---	-3	dB
	Vin = 0	-7	-17	-25	dB
